## **No more choking and burning eyes? Hebrew University Ph.D. Student develops new approach to eliminating allergies, asthma**

Jerusalem, 27<sup>th</sup> June 2007 – Allergies, like the common cold and asthma, have basically defied the best efforts of modern medicine to cure them. Now, a doctoral candidate at the Hebrew University of Jerusalem School of Pharmacy has come up with a new approach that offers hope for getting rid of them.

For his efforts, Chilean-born Ido Bachelet, a first cousin of the president of Chile, Michelle Bachelet, and a Ph.D. student under the supervision of Prof. Francesca Levi-Schaffer, has been named the winner of one of this year's Barenholz Prizes for Creativity and Originality in Applied Research. The award, named for its donor, Yehezkel Barenholz, the Dr. Daniel G. Miller Professor of Cancer Research at the Hebrew University-Hadassah Medical School, was presented recently during the Hebrew University Board of Governors 70th meeting.

Bachelet's research has focused on mechanisms that regulate the function of mast cells – the “villains” in triggering allergic reactions. When exposed to allergens, mast cells react violently and release an enormous array of pro-inflammatory substances, of which histamine is a well known example. These substances lead to acute symptoms ranging from stuffy nose, rash, and airway constriction to the lethal shock known from food or venom allergies. Later on, they attract inflammatory cells that will maintain the response, which often persists as a chronic disease.

Although allergies are usually not perceived as lethal, reality is different. In 2005, over 250,000 people died from asthma worldwide. The World Health Organization estimates that this rate will increase by 20 percent within the next decade if urgent action is not taken. Asthma is the most common chronic disease among children.

Bachelet has identified a receptor protein on mast cells, termed CD300a. This receptor has a prominent negative effect on mast cell activity, virtually shutting down the cell from unleashing allergic responses. Unfortunately, CD300a is widely found throughout the immune system, and simply targeting it could result in undesired, overall immune suppression with serious consequences, as can happen with steroids.

In order to overcome this problem, Bachelet and his research colleague, Ariel Munitz, have designed a small, synthetic, antibody fragment that has the unusual ability of recognizing two targets simultaneously -- the receptor CD300a and a mast cell-specific marker. Thus, the antibody targets CD300a only on the surface of mast cells, avoiding suppression of other immune cells. This antibody potentially eliminated four different types of allergic diseases in mice. Moreover, when mice suffering from severe chronic asthma received the antibody in nose drops, they completely reverted to normal, healthy mice in less than two months.

This pioneering project, termed RECEPTRA, presents a novel therapeutic strategy for acute and chronic allergic diseases, and is currently being licensed through Yissum, the Hebrew University's technology transfer company, to pharmaceutical companies for further development and eventual clinical trials.

Based on its enormous potential, Bachelet and his team predict that with further development, their technology will become the first line of allergy therapy in the near future..

**About the Hebrew University**

With 24,000 full-time students, the Hebrew University of Jerusalem is Israel's pre-eminent institute of higher education. Its faculty members pursue projects that are both essential to Israel's future and the benefit of humanity. It is a centre of international repute, with formal and informal ties extending to and from the worldwide scientific and academic community. Students come from all over Israel and across the Middle East to study in an atmosphere of academic and research excellence.

**About the British Friends of the Hebrew University**

Established in 1926, The British Friends of the Hebrew University is the oldest established Jewish charity in support of higher education. The charity works to promote and enhance the reputation of the Hebrew University, ensure that underprivileged students are given the opportunity to complete their studies, and help HU to maintain its standard of excellence and worldwide reputation for research. BFHU acts as the UK's gateway to Hebrew University research, expertise and faculty, and provides financial and pastoral support for prospective and current students at HU, as well as supporting visiting and sabbatical Hebrew University lecturers during their time in the UK.
